THE FUNDAMENTALS OF BRUSHLESS PERMANENT MAGNET MOTOR DESIGN – PART 1

POWER ELECTRONICS GROUP LLC

5

6

6

WHY DOES THE MOTOR TURN?

POWER ELECTRONICS GROUP LLC

6

WHY DOES THE MOTOR ROTATE?

The diagram illustrates a brushless DC motor with the following components and vectors:

- Windings:** Represented by red dots on the stator.
- Direction of Rotation:** Indicated by a blue curved arrow.
- Magnets:** A blue 'S' (South) and a green 'N' (North) magnet are shown in the center.
- Stator Current Space Vector, I_s :** A red arrow pointing upwards.
- Space Vector, B_r :** A green arrow pointing to the right.

7

QUESTIONS

- How is the current distributed?
- What are the two vectors?
- Which vector is leading and what is the significance of that?
- How can you physically create this space relationship?

10

THE BASICS

- A **magnetic field** can be described using lines of flux;
- Such lines form closed loops;
- Such lines do not cross;
- Such lines when parallel repel one another.

POWER
ELECTRONICS
GROUP LLC

PEG

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

11

11

THE BASICS

- Magnetic fields have north and south poles;
- A current carrying conductor lying in a magnetic field experiences a force;

POWER
ELECTRONICS
GROUP LLC

PEG

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

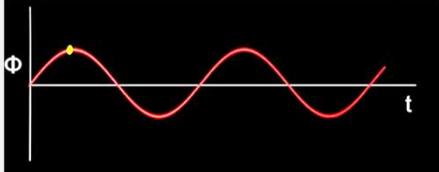

12

12

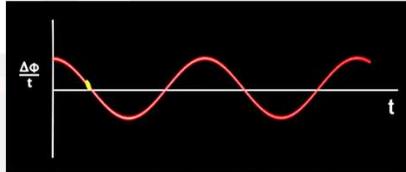

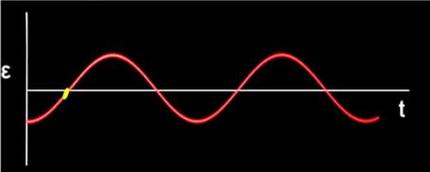

THE BASICS

- Varying magnetic flux linking a circuit induces an EMF (**Faraday's Law**);
- Induced EMF opposes the change of flux (**Lenz's Law**).

$$\mathcal{E} = -N \frac{\Delta\phi}{\Delta t}$$

13

IMPORTANT FORMULAE

- Force $F = BIL$;
- Flux $\Phi = BA$;
- Flux Density $B = \Phi/A$;
- EMF = Blv , v is the rate of change;
- EMF = $-d\Phi/dt$;
- EMF = $-dN\Phi/dt$;

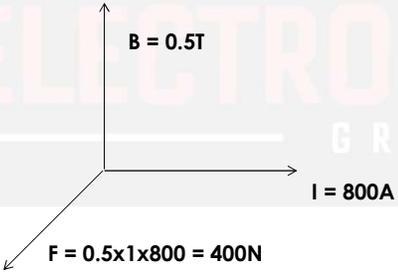

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited. 14

14

THE BASICS

- Force on a Current Carrying Conductor, 1m in length

16

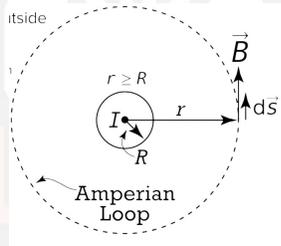

AMPERE'S LAW

➤ Line integral of a magnetic field in a closed path equals net current enclosed;

$$\oint_c B \cdot dl = \mu_0 \sum I_{\text{enclosed}}$$

$$\oint_c H \cdot dl = \oint_s J \cdot ds$$

$$H_c l_c = Ni$$

$$\Rightarrow B \oint ds = B(2\pi r) = \mu_0 I \Rightarrow B = \frac{\mu_0 I}{2\pi r}$$

17

17

AMPERE'S LAW

- Where B-magnetic flux density in Tesla;
- H- magnetic field strength in AT/m;
- N- Number of turns;
- *i*- Current flowing in the path in Amperes;
- *l_c*- length of the path through which current flows in meter;
- J-current density in A/m²;
- Small incremental length-dl and area-ds;

18

18

19

KEY DIFFERENCE SUMMARY (B VS. H)

Concept	Flux Density (B)	Field Intensity (H)
Represents	Magnetic field effect	Magnetic field cause
Depends on	Field intensity and material	Only on current/magnetic sources
Units	Tesla (T)	Amperes per meter (A/m)
Formula	$B = \mu H$	$H = B / \mu$
Affected by material	Yes (Via Permeability)	No (intrinsic to the field source)

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

19

FUNDAMENTALS OF MAGNETIC CIRCUITS

- Magnetic flux in the cross section of a core is given as: $\phi_c = B_c A_c$
- Where Φ is the flux in the core;
- Magnetic Flux density is defined as: $B = \mu H$
- Where μ is the permeability given by: $\mu = \mu_0 \mu_r$
- The flux can be also expressed as:

$$\phi = \mu H . A = \frac{\mu . Ni . A}{l} = \frac{Ni}{R}$$

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

20

20

FUNDAMENTALS OF MAGNETIC CIRCUITS

- Where R is the reluctance given by: $R = \frac{l}{\mu A}$
- Ni is defined as MMF denoted as 'F';
- Flux can also be written as: $\phi = \frac{F}{R}$
- Magnetic circuits are analogous to electric circuits;

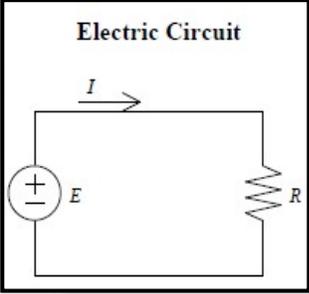

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

21

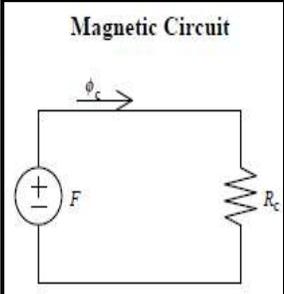

FUNDAMENTALS OF MAGNETIC CIRCUITS

FUNDAMENTALS OF MAGNETIC CIRCUITS

➔

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited. 24

24

FUNDAMENTALS OF MAGNETIC CIRCUITS

- Flux linkage (**Total Flux in a Coil**) is defined as: $\lambda = N\Phi$;
- Magnetic flux linkages of 2 coils is given by:

$$\lambda_1 = \lambda_{11} + \lambda_{12}$$

$$\lambda_2 = \lambda_{21} + \lambda_{22}$$
- First subscript indicates coil of flux linkage;
- Second subscript indicates coil which is carrying current;
- Inductance is defined as: $L = (N\Phi/I) = (\lambda/I)$;

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

25

FUNDAMENTALS OF MAGNETIC CIRCUITS

- Self & Mutual inductances are defined as:
- Self inductance of j coil when j=k;
- Mutual inductance of j & k coil when j not equal to k;

$$L_{jk} = \frac{\lambda_{jk}}{i_k}$$

$$\lambda_1 = L_{11}i_1 + L_{12}i_2$$

$$\lambda_2 = L_{21}i_1 + L_{22}i_2$$

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

26

WHAT IS INDUCTANCE?

- Defines the Geometry of the Magnetic Circuit
- $L = \mu \cdot N^2 \cdot A / l$
- (Geometric Parameters Define Inductance)

Can this formula be significant in determining stator level inductance, L_d and L_q ?

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

27

27

WHAT IS RELUCTANCE?

- Another parameter which defines the geometry of a magnetic circuit;
- $R = l / (\mu \cdot A)$;
- $L = N^2 / R$;
- Inductance is inversely proportional to Reluctance.

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

28

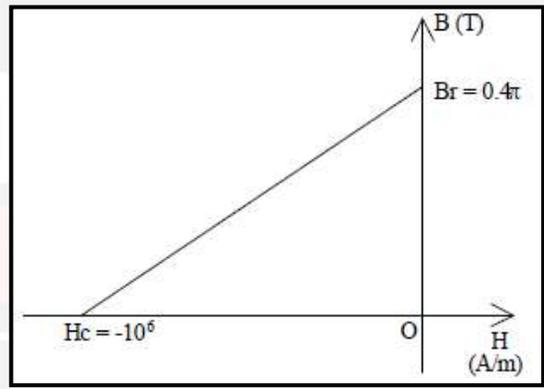

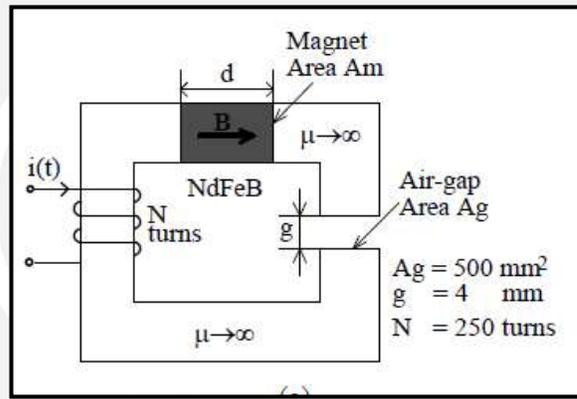

QUESTION

- If I have a magnet placed in a magnetic circuit that also includes an air gap —
- and I assume there's no flux leakage or fringing —
- will the magnetic flux density stay the same throughout the whole path, including through the magnet, the core, and the air gap?

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

CALCULATE

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

A SAMPLE PROBLEM

- $B_g = 0.5 + 0.25.\text{Sin}(\omega t)$;
- 0.5T created by the magnet;
- 0.25T created by the current;
- Find d and i.

31

31

A PERMANENT MAGNET

$$B_m = \frac{B_r}{H_c} (H_m + H_c) = \mu_m (H_m + H_c)$$

$$H_m l_m = \left(\frac{B_m}{\mu_m} - H_c \right) l_m = \frac{l_m}{\mu_m A_m} \phi_m - H_c l_m = R_m \phi_m - F_m$$

44

44

EXAMPLE

- Rotor Parameters
 - Rotor Location = External;
 - Rotor Type = Surface Mount w/ Radial Magnets;
 - Rotor Temperature = 50 deg. C Max;
 - Rotor Magnet Material = NdFeB 36MGOe.

POWER ELECTRONICS GROUP LLC

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

45

45

EXAMPLE

- Stator Parameters
 - Stator Type = Square;
 - Stator Temperature = 100 deg. C;
 - Stator Coil Material = Copper;

POWER ELECTRONICS GROUP LLC

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

46

46

EXAMPLE

- Sizing Parameters
 - Torque per Unit Volume = DNC (Do Not Care);
 - Rated Current Density = DNC;
 - Fill Factor = 40% Minimum;
 - Rotor Stator Diameter Ratio = 0.65;
 - Stator Flux Density = 1.2T Max;
 - Back-EMF limit = 0.9 Max;
 - Magnet air gap ratio = 3.5;
 - Magnet Coverage = 0.95.

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

47

47

EXAMPLE

- Controller
 - Size = Small;
 - Current = 50A peak;
 - Location = Internal;
 - Control Methods = FOC+SVM.

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

48

48

EXAMPLE

- Mechanical Interfaces
 - Gearless;
 - Brake = None;
 - Very Low Cogging Torque.

64

64

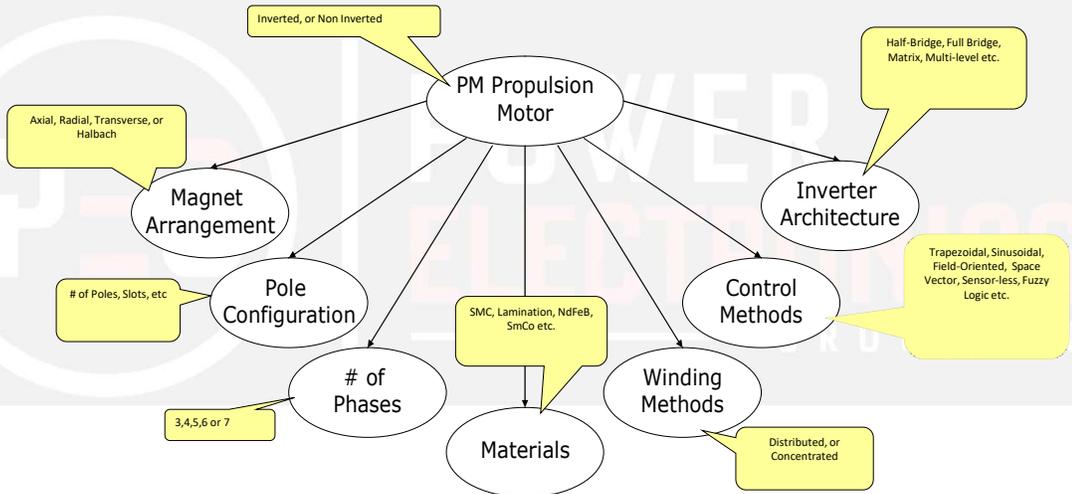

VARIOUS MOTOR ARCHITECTURES

Architecture	Flux Direction	Key Feature	Application Focus	Pros	Cons
Radial Flux Motor (RFM)	Radial	Common, mature design	General industry, EVs, fans	Mature, good performance, easier to manufacture	Limited cooling, longer motor for high torque
Axial Flux Motor (AFM)	Axial	Compact, high torque density	eBikes, aerospace, EVs	High torque density, better cooling, compact	Manufacturing complexity, tight tolerances
Transverse Flux Motor (TFM)	Transverse	High torque, modular	Direct-drive, robotics	Very high torque density, direct-drive suitability	Complex design, higher losses
Flux Switching PM Motor (FSPM)	Radial/Switching	Robust rotor, stator magnets	EVs, high-reliability systems	High reliability, robust rotor	High core losses, complex flux paths
Hybrid Excitation PM Motor	Radial	PM + wound field	Automotive, field-weakening	Wide speed range, tunable field	Added complexity, heavier
Linear Permanent Magnet Motor	Linear	Straight-line motion	Automation, maglev	No conversion loss, precise motion	Costly, niche applications

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

CURRENT STATE OF THE ART

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

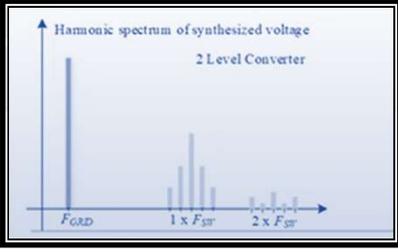

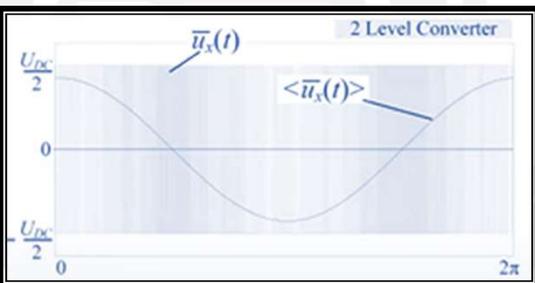

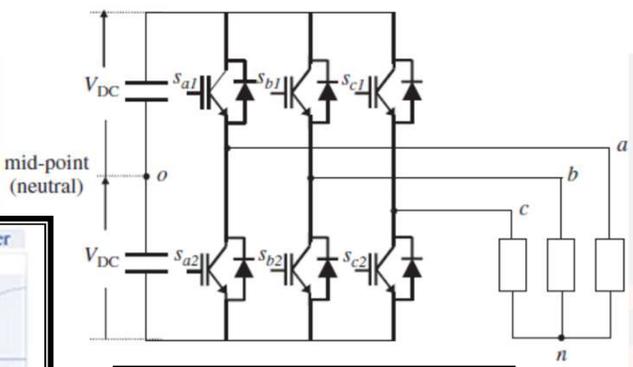

INVERTER ARCHITECTURES

Architecture	Voltage Levels	Complexity	Common Use
2-Level VSI	2	Low	General motor drives, EVs
3-Level NPC	3	Medium	High-power industrial applications
Multilevel (MLI)	5+	High	HVDC, wind/solar farms
Matrix	AC-AC	High	Aerospace, compact systems
CSI	2	Medium	Constant torque applications
Z-Source / qZSI	Variable	Medium	Solar inverters, EVs
Dual Inverter	2x2-Level	High	Aerospace, EVs
Multiphase Inverter	N-Phase	High	Fault-tolerant, high-performance

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

2-LEVEL INVERTER

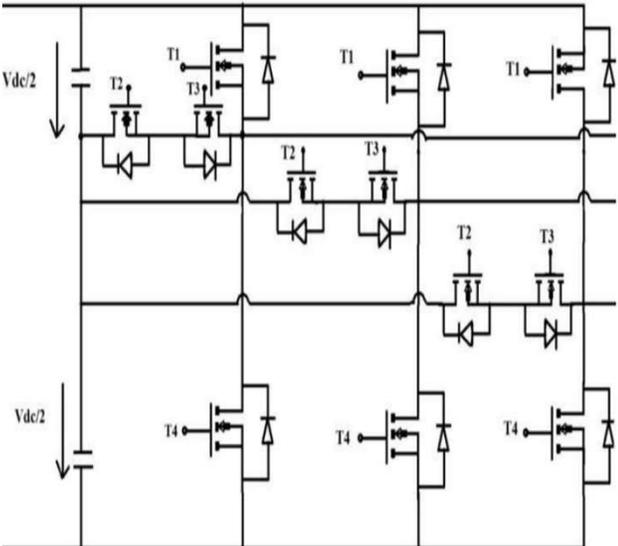

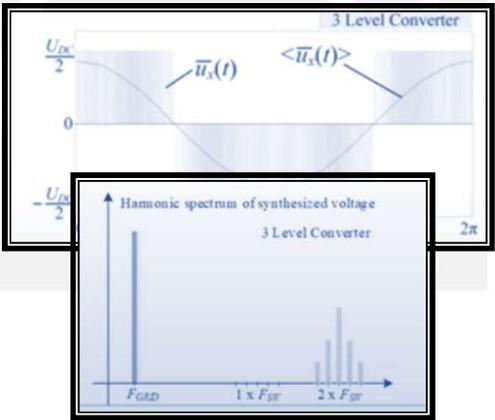

69

3-LEVEL NPC

T-Type Inverter

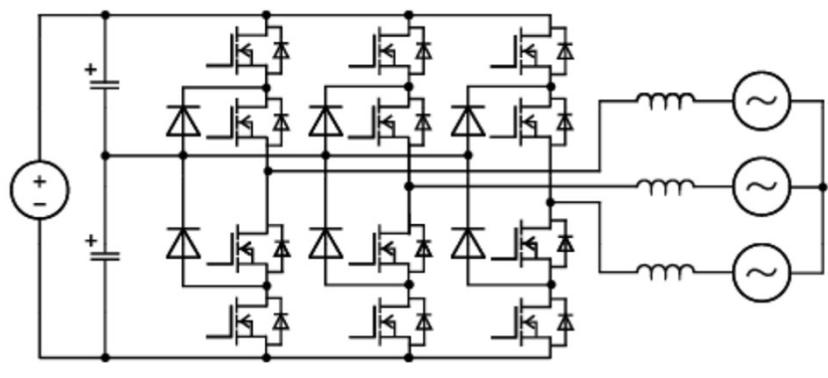

69

70

3-LEVEL NPC

I-Type Inverter

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

70

3 VS. 5 VS. 7

- Advantages:
 - 5 Phase can help reduce motor size;
 - 5 and 7 phases can help reduce inverter size.
- Disadvantages:
 - Controller Complexity

POWER
ELECTRONICS
GROUP LLC

71

WINDING METHODS

- Fractional Slot Concentrated Winding
 - High Power Density;
 - High Efficiency;
 - Short End Turns;
 - High Slot Fill Factor;
 - Low Cogging Torque;
 - Flux Weakening Capability;
 - Fault Tolerance.

ANALYTICAL METHODS – PART 3

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

117

AGENDA

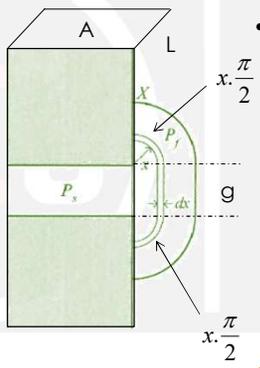

- Magnetic Circuit Concepts;
 - Air Gap Modeling;
 - Slot Modeling;
- Magnetic Materials
 - Core Loss;
 - Permanent Magnet Magnetic Circuit Model

GROUP LLC

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

118

118

AIR GAP MODELING

- The calculation of the air gap permeance using approximation utilizes the fact that permeances add in parallel just as electrical conductances do.

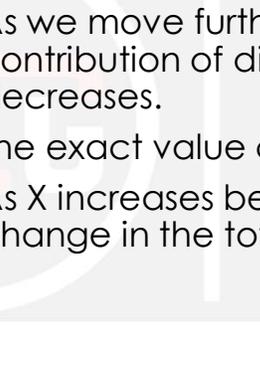

$$P_f = \sum \frac{\mu_0 dA}{l} = \sum \frac{\mu_0 L dx}{l}$$

Contribution

$$P_f = \int_0^X \frac{\mu_0 L}{g + \pi x} dx = \frac{\mu_0 L}{\pi} \ln \left(1 + \frac{\pi X}{g} \right)$$

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

119

AIR GAP MODELING

- As we move further from the air gap the contribution of differential permeances decreases.
- The exact value chosen are not that critical.
- As X increases beyond about 10g, there is little change in the total air gap permeance.

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

120

AIR GAP MODELING

- Discuss its implications with respect to the motor design.
 - Thin Stack Designs
 - Stack Height vs. Air Gap

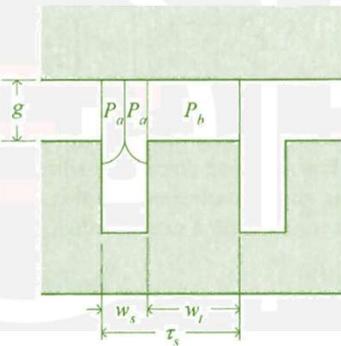

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

121

121

SLOT MODELING

- w_s = Slot Width
 w_t = Tooth Width
 τ_s = Slot Pitch
- Crude approximation
 - Ignore the flux crossing the gap over the slot

$$P_g = \mu_0(A - A_s)/g$$

- $A_s = w_s L$
- Not accurate

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

122

122

SLOT MODELING

- Accurate Methods to determine air gap permeance
 - The flux crossing the gap over the slot travels a further distance before reaching the highly permeable material across the gap

$$P_g = \mu_0 \cdot \frac{A}{g_e}$$

$$g_e = k_c \cdot g$$

- $K_c > 1$ is an air gap length correction factor and is known as Carter's coefficient

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

123

123

SLOT MODELING

- Conformal Mapping Technique
 - Carter was able to determine an analytic magnetic field solution
 - Analytical expressions for Carter's coefficient

$$K_{c1} = \left[1 - \frac{1}{\frac{\tau_s}{w_s} \left(5 \frac{g}{w_s} + 1 \right)} \right]^{-1}$$

$$K_{c2} = \left[1 - \frac{2w_s}{\pi \tau_s} \left\{ \tan^{-1} \left(\frac{w_s}{2g} \right) - \frac{g}{w_s} \ln \left[1 + \frac{1}{4} \left(\frac{w_s}{g} \right)^2 \right] \right\} \right]^{-1}$$

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

124

124

SLOT MODELING

- Air gap permeance calculation utilizes the circular arc, straight line modeling
 - The permeance of the air gap over one slot pitch τ_s

$$P_g = 2P_a + P_b = \mu_0 L \left[\frac{w_t}{g} + \frac{4}{\pi} \ln \left(1 + \frac{\pi w_s}{4g} \right) \right]$$

$$K_{c3} = \left[1 - \frac{w_s}{\tau_s} + \frac{4g}{\pi \tau_s} \ln \left(1 + \frac{\pi w_s}{4g} \right) \right]^{-1}$$

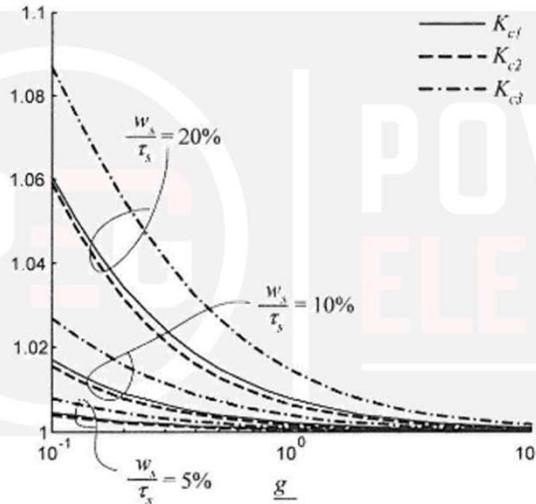

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

125

SLOT MODELING

- K_{c3} dictates a larger correction factor than either of the historical Carter's coefficient expressions

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

126

SLOT MODELING

- The correction factor **increases** as the slot percentage w_s/τ_s increases (Slot Width Increases).
- Correction factor **decreases** as the relative gap length g/τ_s increases (Air Gap Increases).
- **Smaller slot openings and larger air gap lengths** require less correction because the influence of the longer flux path length in the slot area is decreased.

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

127

127

SLOT MODELING

- The presence of a permanent magnet across the air gap from the slotted structure changes the computation of Carter's coefficient.
- The air gap length g must be replaced by $g + l_m/\mu_R$

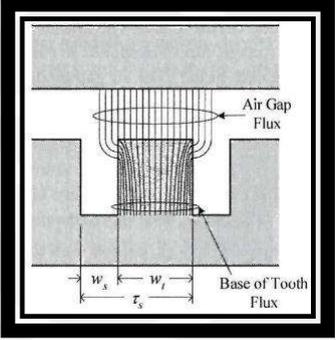

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

128

128

SLOT MODELING

- The presence of slots squeezes the air gap flux into a cross-sectional area $(1-w_s/\tau_s)$ times smaller than the cross-sectional area of the entire air gap over one slot pitch.
- The average flux density $B=\phi/A$ at the base of the teeth is greater by a factor of $(1-w_s/\tau_s)^{-1}$

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

129

129

SLOT MODELING EXAMPLE

- Average flux density crossing the air gap is 1.0 T
- Slot fraction, $\alpha_s = w_s/\tau_s$ is 0.5
- The average flux density in the base of the teeth is 2.0 T.
- Since this flux density level is sufficient to saturate most magnetic materials, there is an upper limit to the achievable air gap flux density in a motor.

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

130

130

WHAT IS AN AIR GAP LENGTH CORRECTION FACTOR?

- Discuss its implications with respect to the motor design
 - Consider Small Air Gap (<math><0.5\text{mm}</math>)
 - Discuss Manufacturing Implications;
 - Discuss Performance Implications.
 - Consider Small Slot Width
 - Repeat the above exercise

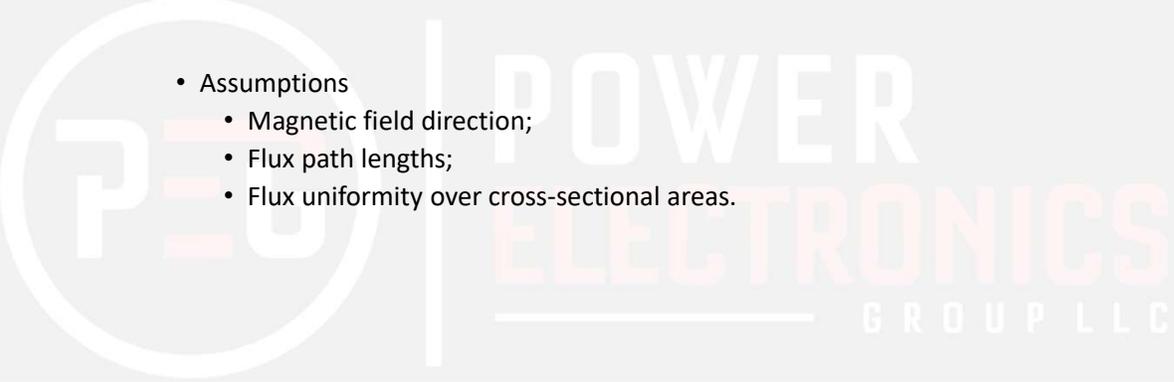

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

131

MAGNETIC MATERIAL ANALYSIS

- Assumptions
 - Magnetic field direction;
 - Flux path lengths;
 - Flux uniformity over cross-sectional areas.

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

132

132

PERMANENT MAGNETS

- Permanent magnets are magnetic materials with **large hysteresis loops**
 - Alnico
 - Ferrite (ceramic)
 - Somarium-cobalt
 - Neodymium-iron boron (NdFeB)
- Ferrite types are the most popular because they are inexpensive.
- NdFeB magnets are more popular in higher performance applications because they are much cheaper than somarium cobalt

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

133

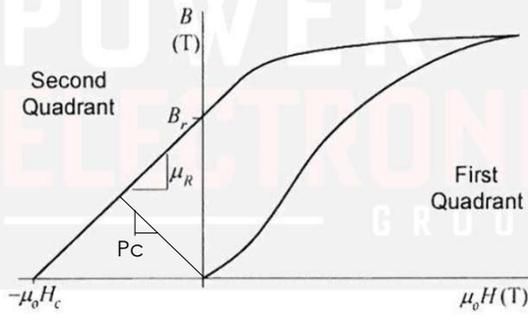

133

PERMANENT MAGNETS

- The remanence is the maximum flux density that the magnet can produce by itself

1. Which quadrant is significant for motor design?
2. What is the significance of the first quadrant?

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

134

134

PERMANENT MAGNETS

- At $B=0$, the magnitude of the field intensity across the magnet is equal to the negative of the coercivity or coercive force, denoted H_c because H_c is stated as a positive value on permanent magnet specifications.
- The magnitude of the slope of a line drawn from a point on the curve to the origin is known as the permeance coefficient, denoted P_c .
- $P_c=0$ is operation at the coercivity $B=0$, $H= -H_c$, and $P_c=\infty$ is operation at the remanence $B=B_r$, $H=0$.

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

135

135

PERMANENT MAGNETS

- Permanent magnet materials such as samarium-cobalt and NdFeB materials have straight demagnetization curves throughout the second quadrant at room temperature
- The slope of the straight line demagnetization curve in the second quadrant is equal to μ_r , where μ_r is the **relative recoil permeability** of the material.

Do Magnets store energy? Why is this energy not dissipated like in a battery?

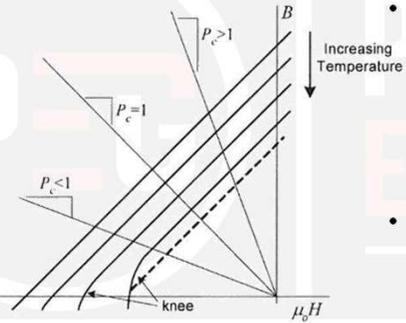

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

136

136

PERMANENT MAGNETS

- At higher temperatures, the demagnetization curve shrinks toward the origin, the flux available from the magnet drops, reducing the performance of the magnet.
- This performance degradation is reversible as the demagnetization curve returns to its former shape as temperature drops

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

137

137

PERMANENT MAGNETS

- The maximum energy product $(BH)_{max}$ of a magnet is the maximum product of the flux density and field intensity along the magnet demagnetization curve.
- Even though this product has units of energy, it is not actual stored magnet energy, but rather it is a qualitative measure of a magnet's performance capability in a magnetic circuit.
- By convention, $(BH)_{max}$ is usually specified in the English units of millions of Gauss – Oersteds (MG-Oe).
- $1\text{MG-Oe} = 7.958 \text{ kJ/m}^3$

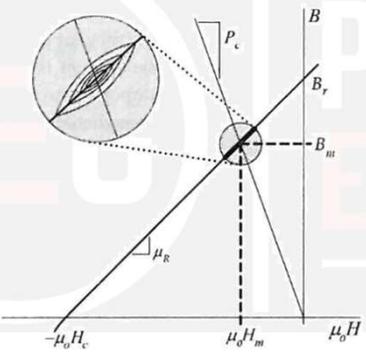

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

138

138

PM MAGNETIC CIRCUIT MODEL

- When motor windings are energized, the operating point dynamically varies following minor hysteresis loops about the static operating point

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

139

139

PM CIRCUIT MODEL

- Loops:** These loops are thin and have a slope essentially equal to that of the demagnetization characteristic.
- Trajectory:** The trajectory closely follows the straight line demagnetization characteristic

$$B_m = B_r + \mu_R \mu_0 H_m$$
- Demagnetization:** If the external magnetic field opposes that developed by the magnet and drives the operating point into the third quadrant past the coercivity, it is possible to irreversibly demagnetize the magnet if a knee in the characteristic is encountered.

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

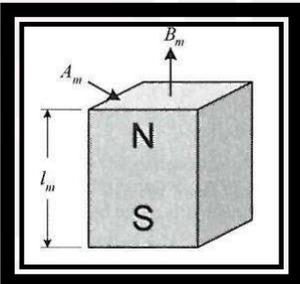

140

140

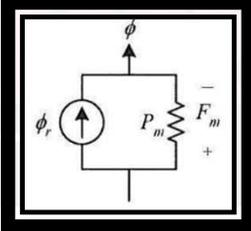

PM MAGNETIC CIRCUIT MODEL

Rectangular magnet Flux leaving the magnet is

$$\phi = B_m A_m = B_r A_m + \mu_R \mu_0 A_m H_m$$

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited. 141

141

PM MAGNETIC CIRCUIT MODEL

$$\phi = \phi_r + P_m F_m$$

$$\phi_r = B_r A_m$$

$$P_m = \frac{\mu_R \mu_0 A_m}{l_m}$$

- Uniform Magnetization: It is important to recognize that this model assumes that the physical magnet is uniformly magnetized over its cross section and is magnetized in its preferred direction of magnetization

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited. 142

142

PM CIRCUIT MODEL

- **Uniformity:** During magnetization the same amount of flux magnetizes each differential length.
- **Br:** The achieved remanence decreases linearly with increasing radius because the same flux over a increasing area gives a smaller flux density.

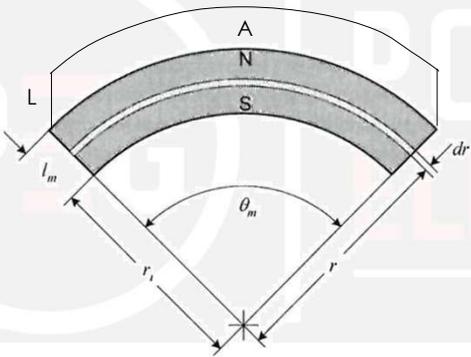

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

143

143

PM MAGNETIC CIRCUIT MODEL

$$dR = \frac{dl}{\mu A} = \frac{dr}{\mu r \theta_m L}$$

- Because reluctances add in series just as resistors do, the net reluctance of the magnet is given by the sum, i.e., integral, of each differential reluctance

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

144

144

PM MAGNETIC CIRCUIT MODEL

$$R_m = \int_{r_i}^{r_i+l_m} dR = \int_{r_i}^{r_i+l_m} \frac{1}{\mu_R \mu_o L \theta_m r} dr = \frac{\ln\left(1 + \frac{l_m}{r_i}\right)}{\mu_R \mu_o L \theta_m}$$

$$P_m = \frac{\mu_R \mu_o L \theta_m}{\ln\left(1 + \frac{l_m}{r_i}\right)}$$

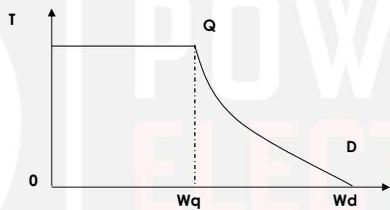

$$P_m = \frac{\mu_R \mu_o L \theta_m r_i}{l_m}$$

- Which is equivalent to the permeance of a rectangular block having width $\theta_m r_i$ and length l_m . That is, the magnet appears to have a constant width given by the arc width at r_i

TWO PHASE MOTOR EQUATIONS

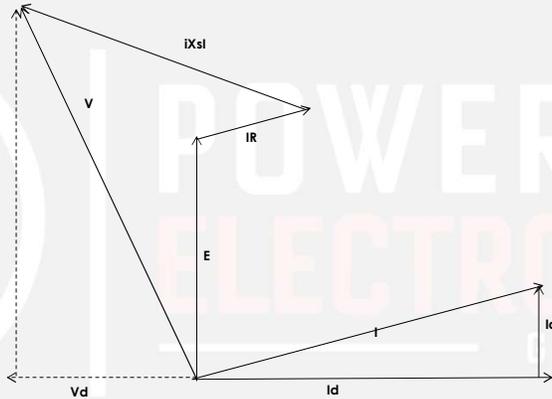

$$\text{At } W_q, I_d = 0; I_q = I_c; V_q = E_{qo}; V_d = -X_{so} I_c$$

$$\text{At } W_d, I = I_d = -I_c = \frac{V_c - xE_{qo}}{xX_{so}}$$

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

DESIGN

$$V = E + (R + jX_s)I$$

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

147

DESIGN

At Wq,

$$I_d = 0$$

$$I_q = I_c$$

$$V_q = E_{q0}$$

$$V_d = -X_{so} I_c$$

$$I = jI_q = jI_c$$

$$V_c^2 = E_{q0}^2 + X_{so}^2 I_c^2$$

$$I_c = \sqrt{\frac{V_c^2 - E_{q0}^2}{X_{so}^2}}$$

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

148

148

DESIGN

At ω_d ,

$$I = I_d = -I_c = \frac{V_c - xE_{q0}}{xX_{so}}$$

$$x = \frac{W_d}{W_q}$$

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

149

DESIGN

For a given speed N , rpm

$$\omega_e = \frac{2 \cdot \pi \cdot N}{60} \cdot p$$

$$E_o = \lambda \cdot \omega_e$$

$$X_q = \omega_e \cdot L_q$$

$$X_d = \omega_e \cdot L_d$$

Field Weakening Equation

$$I_d = \frac{-\lambda L_d + \sqrt{\lambda^2 L_d^2 + (L_q^2 - L_d^2) - \left(\lambda^2 - \left(\frac{V_{ph}}{\omega_e} \right)^2 + I_{cmax}^2 L_q^2 \right)}}{L_d^2 - L_q^2}$$

$$\lambda = \frac{Nd \phi}{dt} = L \frac{di}{dt}$$

ESTIMATING MOTOR PARAMETERS – PART 5

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

165

AGENDA

- Assumptions;
- Modeling of PMSM motor;
- Estimate actual motor parameters;
- Example;

GROUP LLC

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

166

166

ASSUMPTIONS

- Stator windings produce sinusoidal MMF;
- Space harmonics in the air-gaps are neglected;
- Air-gap reluctance have a constant & sinusoidally varying component;

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

167

167

ASSUMPTIONS

- Balanced 3-phase supply voltage;
- Eddy currents & Hysteresis effects neglected;

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

168

168

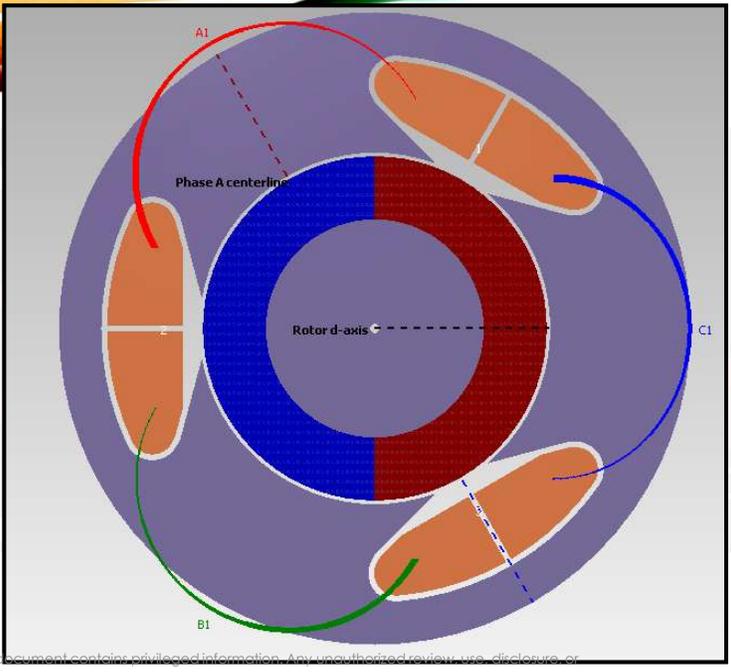

MODELING OF PMSM MOTOR

- Stator reference axis for phase-A is chosen in the direction of maximum MMF when a positive phase A current is maximum;
- Stator self inductances are maximum when rotor q-axis is aligned with the particular phase;
- Mutual inductances are maximum when rotor q-axis is midway between two phases;

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

169

170

MODELING OF PMSM MOTOR

Self Inductance
Leakage Inductance
Magnet Interaction

$$L_{aa} = L_{s0} + L_{s1} + L_x \cos(2\theta)$$

$$L_{bb} = L_{s0} + L_{s1} + L_x \cos(2\theta + 120)$$

$$L_{cc} = L_{s0} + L_{s1} + L_x \cos(2\theta - 120)$$

$$L_{ab} = (-1/2)L_{s0} + L_x \cos(2\theta - 120)$$

$$L_{bc} = (-1/2)L_{s0} + L_x \cos(2\theta)$$

$$L_{ca} = (-1/2)L_{s0} + L_x \cos(2\theta + 120)$$

2θ is the terms introduced due to saliency

When q-axis is aligned with the particular phase, self-inductance is maximum.

When q-axis is midway between phases, mutual-inductance is maximum.

200

ESTIMATION OF PARAMETERS

- Resistance:
- Line to line R is measured with an RLC meter;
- Half the value gives R/phase;
- Neglecting skin effect R is given by:
 - $R_t = R_0 (K + T) / (K + T_0)$
 - Where R_0 is the resistance measured at T_0 ;
 - R_t is the value at different temperature;
 - $K=243.5$ constant of the material (copper);

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

201

201

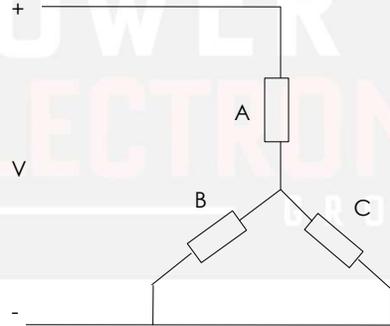

ESTIMATION OF PARAMETERS

- Synchronous Inductances L_d & L_q :

$$V = \{(3/2)R_s + (3/2)L_q p\} I_q$$

$$L_q = (2/3)L(\theta = 0^\circ)$$

$$L_d = (2/3)L(\theta = 90^\circ)$$

203

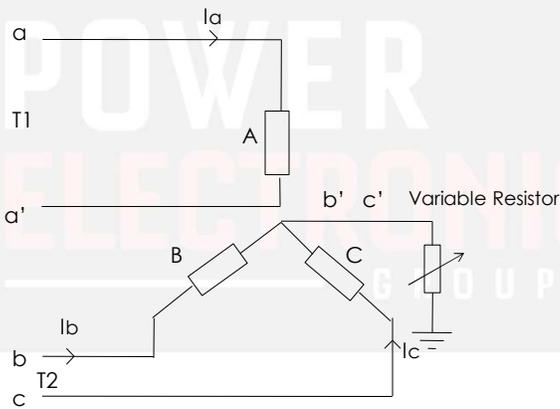

203

ESTIMATION OF PARAMETERS

Circuit for general Inductance Measurement

Lock the rotor, keep the currents balanced and measure inductance for various values of current and position. Position is simulated by different current magnitudes.

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

204

204

ESTIMATION OF PARAMETERS

- Permanent magnet flux linkage;

$$\lambda_m = \sqrt{(2/3)} \cdot V_{nl} / \omega$$

- Where, $\omega = \omega_m (P/2)$;
- BEMF const $K_e = V_{nl} / \omega$;
- Maintaining orthogonal at stand still λ_m can be found as: $\lambda_m = (2/3) \cdot (2/P) T / I_s$
- Where I_s is peak current value;

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

205

205

ESTIMATION OF PARAMETERS

- Let L_{q0} , L_{d0} & λ_{m0} be the values in the linear region;
- In linear region $|I_q| < |I_0|$;
- But at high currents $|I_q| > |I_0|$;
- L_q is subjected to saturation;
- L_d & λ_m are subjected to armature reactions;
- At high currents Frolich's formula can be used for calculating L_d , L_q & λ_m ;

Copyright 2025-26 PEG This document contains privileged information. Any unauthorized review, use, disclosure, or distribution is prohibited.

206

206

ESTIMATION OF PARAMETERS

- Frolich's formula:

$$L_q(I) = L_{q0}(a + I_0) / (a + |I_q|)$$

$$L_d(I) = L_{d0}(b + I_0) / (b + |I_q|)$$

$$\lambda_m(I) = \lambda_{m0}(b + I_0) / (b + |I_q|)$$
